Content

1. Introduction
2. Entity Relationship Diagram
3. Relational Mapping
4. Data Normalization
5. Data Dictionary
6. SQL Table Creation
7. Sample Data
8. SQL Views
9. SQL Triggers
10. SQL Stored Data Procedures

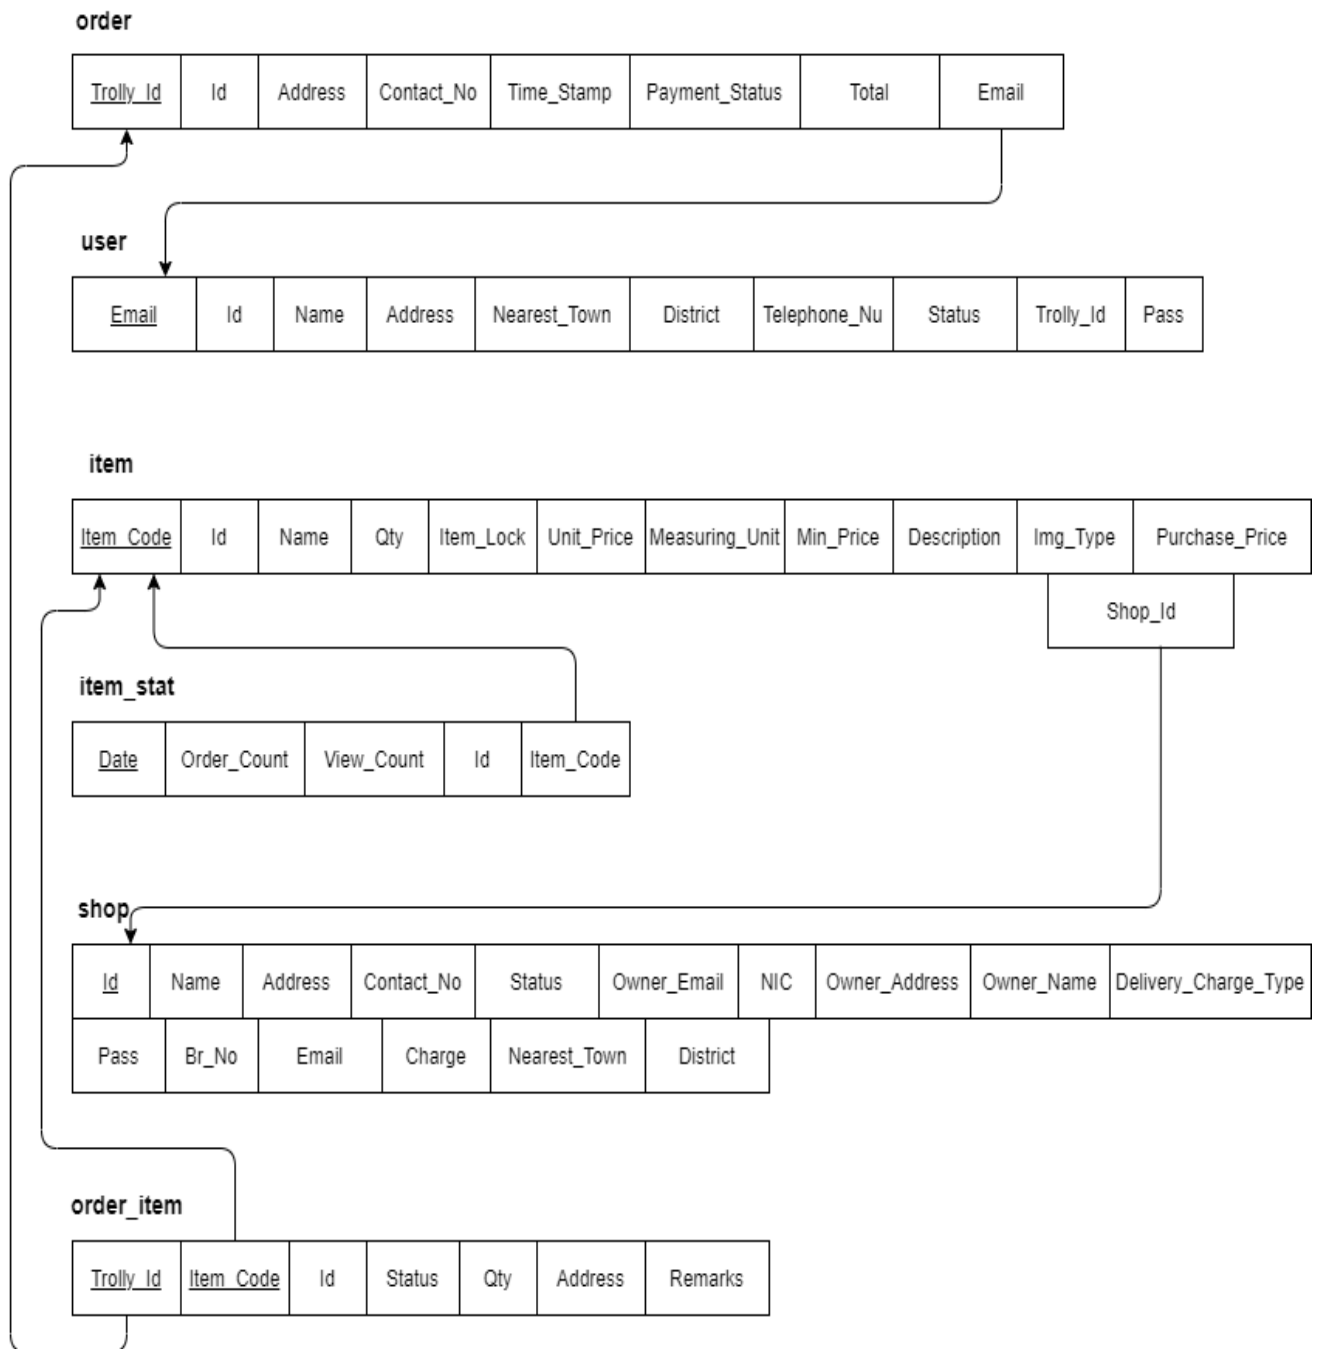

Introduction

This mobile application is designed in order to support the customers and sellers in buying and selling their products. This will give sellers an opportunity to commence their store and customers to buy the product with their choices. The shopping cart is an online retailer's site is a piece of software that facilitates the purchase of a product or service. It accepts the customer's payment and organizes the distribution of that information to the merchant, payment processor and other parties. This mobile application also will have a regular shopping cart followed by normal payment processors. The transactions will be based on the POS System. This will enhance the distribution of products to customers as soon as possible. Finally, this application will build a proper platform for both sellers and buy.

ER Diagram

Relational Mapping

Normalization

➤ **1st normal Form**

Basic rules that a table should follow to be in 1st Normal Form,

- Each column should contain atomic values.
- A column should contain values that are of the same type.
- Each column should have a unique name.
- Order in which data is saved doesn't matter.

➤ **2nd Normal Form**

Basic rules that a table should follow to be in 1st Normal Form,

- It should be in the First Normal form.
- And, it should not have Partial Dependency.

➤ **3rd Normal Form**

Basic rules that a table should follow to be in 3rd Normal Form,

- It is in the Second Normal form.
- And, it doesn't have Transitive Dependency.

All tables are already normalized.

Data Dictionary

Orders

Conclusion

“Marketeka.lk” allows any type of retailer under any capacity to sell his items to customers with convenience. The database we developed to it can predict ups and downs in future sales. Another special feature this database gives is, if one customer adds several items to his/her cart from several retailers, at the time when he is checking out the cart, he just need to make a single payment which is divided among the retailers without any hassle. Therefore this will be a much convenient platform for both retailers and customers.
